UP42 Hiring Team

UP42

RE: CUSTOMER SUCCESS MANAGER

Dear UP42 Hiring Team,

I'm writing to apply for the Customer Success Manager role. UP42 sits at an intersection I've spent my whole career circling — Earth observation data, and the customer relationships that turn a technical platform into something a business actually relies on.

The geospatial half of my background goes back to my undergraduate degree: a BA in Geography (GIS), with Honors, from Colgate, where my thesis was in spatial statistics. I've worked hands-on in QGIS (a disaster-response mapping internship with the Humanitarian OpenStreetMap Team), and in ArcGIS, Mapbox, and Carto during three years on the National Park Service's Digital Maps team, building wildfire-perimeter and endangered-species maps for non-GIS staff. At Teren, a geospatial-risk company, I spent three years around machine learning and drone imagery used to assess infrastructure for physical risk — surface hydrology, encroachment, noxious weeds. **I don't need to be introduced to remote sensing or the providers UP42 works with — I've been inside that world for most of my career.**

The customer success half is just as real, even where the titles said something else. As a Sr. Technical Consultant at Lytics, I owned an enterprise engagement end-to-end — kickoff through delivery, tens of millions of records translated into something the customer's team could actually use — and helped build the delivery playbook the team used on future accounts. At Homebot, I trained and onboarded beta customer cohorts and translated technical findings for a non-technical audience. Both roles were about the same thing a book of business is about: understanding what someone is trying to accomplish, and making sure the product gets them there.

On the more specific asks in the posting: I have a working understanding of APIs from building data pipelines and CRM integrations across several roles, though I wouldn't call myself an API engineer. And on the bonus point about prototyping automations with AI coding tools — that's not aspirational for me, it's what I'm doing right now. I'm a founding technical advisor at a small startup where I build agentic workflows, RAG pipelines, and API-connected automations using Claude Code for non-technical end users. I'd bring that same instinct to reporting pipelines and internal tooling at UP42.

I'm based in Boulder, Colorado, and would be looking to do this role remotely from the US. I'd welcome the chance to talk through what that would look like in practice, along with the Teren geospatial-risk work or the Lytics engagement in more detail.

Thank you for considering my application.

Warmly,

Katrina Engelsted
